STEP-BY-STEP GUIDE

Hosting Your Website on Cloudflare

How to create your own Cloudflare account and give your developer access to publish your project.

Why your own account?

You own it

Your website, domain and data stay in your account.

You control the costs

Cloudflare is free for most small websites. If you ever upgrade to a paid plan, the bill goes to you.

It stays secure

You never share your password. You invite your developer as a member and can remove access at any time.

What you need

- An e-mail address you can access (a business address is best)
- About 10 minutes
- Your developer's e-mail address (used in Step 6)

Already have a Cloudflare account? Skip Part 1, log in at dash.cloudflare.com and continue with Part 2.

PART 1

Create your Cloudflare account

1

Open the sign-up page

In your web browser, go to the address below.

dash.cloudflare.com/sign-up

2

Create your account

Enter your e-mail address and choose a strong password (at least 12 characters), then click **Sign up**. If the page offers a button to continue with **Google** or **Apple**, you can use it instead of a password; the account will then be tied to that login.

3

Confirm your e-mail

Cloudflare sends you a message with a confirmation link. Open it and click the link. If you can't see the message, check your spam folder.

4

Turn on two-factor authentication (recommended)

This protects your account even if someone learns your password. Use an authenticator app on your phone. If Cloudflare asks you to add a website right away, you can leave that for later; your developer will do it.

Profile → Authentication → Two-Factor Authentication

PART 2

Give your developer access

5 Open the members list

Log in at dash.cloudflare.com. In the left-hand menu choose **Manage account**, then **Members**.

Manage account → Members

6 Invite your developer

Click **Invite**. In the e-mail field, type your developer's address (below). For the role, choose **Administrator**. On free accounts this is already the default role for new members.

Invite → Role: Administrator

Developer e-mail: **milos300399@gmail.com**

7 Send the invitation

Confirm to send. Your developer receives an e-mail and accepts it; your account then appears in their account list. Let them know the invitation has been sent.

8 Done!

From here your developer publishes the project into your account. You don't need to do anything else, and you don't need a GitHub account.

Good to know

What the Administrator role allows

The Administrator can configure the website, DNS records and database, and publish the project. They **cannot** change your billing details or add and remove members. That stays with you only.

Never send anyone

- Your Cloudflare password
- Codes from your two-factor authentication app
- Bank card details by e-mail or chat (you enter these yourself in Cloudflare, under Billing)
- Your “Global API Key”

Costs

The free plan is enough for most small websites. If a site outgrows it, your developer will let you know and you decide whether to upgrade (paid plans start at around 5 USD per month; prices may change). You enter your card yourself in Cloudflare.

Removing access

You can end your developer's access at any time: **Manage account → Members**, then choose the option to remove or revoke access next to their name. Your website stays in your account.
